

Expungement.ai User Flow

1. Entry Point

User clicks:

Check for free

This starts the free eligibility screening.

2. Free Qualification Questionnaire

User answers basic screening questions about:

- State/jurisdiction
- Case type
- Arrest/charge/conviction status
- Completion of sentence/probation/fines, where relevant
- Timing/waiting period issues
- Disqualifying factors

No account required yet.

3. Qualification Result

When the system identifies a possible paid path, the user sees:

A path may be available.

Supporting copy should be careful:

Based on what you told us, there may be a record-clearing path available.
Expungement.ai can help you generate a packet and next-step instructions.

Primary CTA:

Generate my packet — \$50

Secondary CTA:

Save and come back later

4. Account Creation

After clicking **Generate my packet — \$50**, the user is asked to create an account.

Account creation should capture:

- First name
- Last name
- Email
- Password

Important: the screening answers must be saved to the account/session so the user does not have to restart.

5. Email Verification

After signup, the user verifies their email.

Once verified, they should be automatically redirected to the Stripe payment gate.

The page should say something like:

Email verified. You're ready to generate your packet.

CTA:

Continue to payment

Ideally, this redirects automatically after a few seconds.

6. Stripe Payment Gate

User pays:

\$50 packet generation fee

After successful payment, Stripe redirects them to their Briefcase.

7. Briefcase Landing

Once inside the Briefcase, the user should be greeted personally:

Welcome, Roger.

Then show a clear status card:

Your packet is almost ready.

We need a few more details before we can generate your documents and next-step instructions.

Primary CTA:

Finish my packet information

The Briefcase should clearly show where they are in the process:

1. Free screening — Complete
2. Account created — Complete
3. Payment — Complete
4. Packet information — In progress
5. Packet generated — Locked until complete
6. Filing next steps — Locked until packet generated

8. State-Specific Packet Builder

Once the user is in the Briefcase, Expungement.ai should say:

Welcome, Roger.

We found a possible path in **Mississippi**. To generate your packet, we need a few more details required for that state.

The information requested should be based on:

1. **State**
2. **County/court**
3. **Type of record**
4. **Case outcome**
5. **Specific expungement/sealing route**
6. **Packet type being generated**

So instead of one universal form, the system should load the correct state packet questions.

Core Information Collected Everywhere

These are likely universal:

- Full legal name

- Other names used
- Date of birth
- Current mailing address
- Phone number
- Email
- Case state
- County
- Court, if known
- Case number, if known
- Arrest date, if known
- Charge/offense name
- Case outcome
- Date the case ended, if known

State-Specific Information

Then each state adds its own required fields.

Examples:

Mississippi

May need:

- County of arrest or conviction
- Court type
- Charge
- Case number
- Disposition date
- Whether fines, fees, probation, or sentence terms are complete
- Whether this is a first offense, where relevant

Illinois

May need:

- Arresting agency
- Police department or circuit court details
- State Police/Bureau of Identification-related information
- Disposition type
- Waiting period facts
- Prior sealing/expungement history, if relevant

DC

May need:

- Whether the case is arrest-only, dismissed, acquitted, conviction-based, or juvenile-related
- Case date
- Waiting period facts
- Whether the person has new convictions
- Which court handled the matter

Pennsylvania

May need:

- County
- Court of Common Pleas or Magisterial District Court info
- OTN/docket number, if known
- Charge grading
- Disposition
- Whether restitution/costs are complete
- Whether a clean-slate route or petition route applies

The key is: **the Briefcase should only ask what that state route needs to generate the right packet.**

Important Product Rule

Do **not** block packet generation just because the user does not have outside paperwork yet.

For example, if a state requires a criminal history report, certified disposition, fingerprint card, agency certificate, or official third-party form, the system should say:

You may need to obtain this before filing. We'll include instructions in your packet.

But that should not stop them from generating the paid packet.

Better User-Facing Language

Instead of:

Provide more information so your packet can be generated.

Use:

We need a few state-specific details to prepare your packet. Some states require different information, so we'll only ask for what applies to your case.

Better Product Logic

The flow should work like this:

Screening result identifies state + route → user pays → Briefcase loads the correct state-specific Packet Builder → user completes required packet fields → packet generates → next-step checklist includes any outside forms/documents they still need.

Updated Step 8 in the Flow

8. State-Specific Packet Builder

After payment, the user lands in their Briefcase and sees:

Welcome, Roger.

Your case appears to have a possible record-clearing path in Mississippi. Before we generate your packet, we need a few details required for Mississippi packets.

The Packet Builder should dynamically ask only the questions needed for that state and route.

The user should be able to answer:

- I know this
- I do not know
- I need help finding this

For missing information that is not absolutely required to generate the packet, the system should still allow generation and include guidance in the next-steps packet.

CTA:

Continue packet builder

Final CTA once required fields are complete:

Generate my packet

System Rule

Each state profile should have its own packet-intake schema:

- Required fields
- Optional fields
- Conditional fields
- External documents needed before filing

- State-specific filing instructions
- Court/agency filing destination
- Fee guidance
- Warnings or limitations

So the Briefcase is not just a document locker. It becomes the user's **state-specific case workspace**.

9. Generate Packet

Once all required internal fields are completed, the user can click:

Generate my packet

The system generates:

- Prepared petition/motion/pleading documents where available
- Filing instructions
- Next-step checklist
- Required external forms/documents they may need to obtain
- Expected fees, where known
- Court/agency filing guidance
- Plain-English warnings and disclaimers

After generation, the Briefcase status changes to:

Packet ready

CTA:

Download my packet

Secondary CTA:

View filing checklist

10. Briefcase Main Menu

The Briefcase should include a permanent menu item:

Check another case

This allows the user to run another free qualification screening for a different arrest, charge, conviction, or jurisdiction.

Other suggested menu items:

- My Briefcase
- My Packet
- Filing Checklist
- Check Another Case
- Case Outcome
- Account Settings
- Help

11. Post-Packet Follow-Up

After packet generation, the Briefcase should motivate users to come back and report what happened.

Add a persistent card:

Tell us what happened with your case

Copy:

After you file, come back and let us know what happened. Your update helps us improve Expungement.ai and helps us understand how record clearing is working in real life.

CTA:

Update my case status

Possible status options:

- I have not filed yet
- I filed my packet
- The court accepted my filing
- The court asked for more information
- My record was cleared
- My request was denied
- I need help understanding what happened

To motivate completion, frame it around impact:

Your update helps us improve the process for the next person.

You could also add an incentive later, like:

Report your outcome and receive a discount on a future packet or background check review.

Clean Final Flow

Check for free → Qualification questionnaire → A path may be available → Pay \$50 to generate packet → Create account → Verify email → Stripe payment → Briefcase → Complete packet information → Generate packet → Download packet + filing checklist → Return later to report case outcome

The biggest things to protect are: no account wall before the free check, no payment until a path may be available, no duplicate screening after signup, and no blocking packet generation just because the user still needs outside documents.
