

Yes. I would change the partner flow so **account creation happens before the screening**, and then separate users into two different concepts:

- 1. Partner portal account** — every partner user creates one.
- 2. Billable / cap-counted packet user** — only counts against the partner cap if there is a record-clearing path and packet generation is unlocked/generated.

That keeps the partner program accurate and useful without punishing the partner for sending people who turn out not to qualify.

Updated Partner Flow

1. Partner Co-Branded Landing Page

User enters through:

[Partner Name] × LegalEase

CTA:

Start your record-clearing screening

Copy:

Create a free account to save your answers, access your Briefcase, and receive support through [Partner Name].

This is different from the commercial flow. On the partner side, we are not trying to avoid account friction for lead generation. We want every participant attached to a real Briefcase.

2. Create Account / Sign In

Before the questionnaire starts, user is prompted to:

Create your free Briefcase

Collect:

- First name
- Last name

- Email
- Password
- Phone number, optional but recommended
- Consent to receive program updates/support communications
- Partner attribution automatically captured in the background

If the user already has an account:

Sign in to continue

Important system rule:

Creating an account through a partner portal does not count against the partner's packet cap.

3. Email Verification

The user verifies their email.

Recommended language:

Verify your email so we can save your screening, keep your Briefcase secure, and help you return later.

After verification, redirect to the partner screening inside their Briefcase.

If you want to reduce friction at live events, you could let them begin the questionnaire immediately after signup, but require verification before packet generation or support follow-up.

4. Start Partner Screening

The screening now happens inside the user's Briefcase/account.

Questions should be more accurate and support-oriented than the commercial flow:

- State where the case happened
- County
- Court, if known
- Arrest, charge, or conviction status
- Case outcome
- Sentence/probation completion

- Fines, fees, restitution status
 - Waiting period facts
 - Open cases or pending charges
 - Whether they need help finding case information
-

5. Accuracy Review

Before showing the result, include:

Let's make sure we have this right

Show a summary:

You told us this case happened in Mississippi.
You were convicted.
The case was in Hinds County.
You completed probation.
You are not sure whether all fines and fees are paid.

CTA:

Yes, this looks right

Secondary CTA:

Edit my answers

6. Screening Result

The result should sort the user into one of several lanes.

Lane A: Packet path may be available

Copy:

Based on what you told us, a record-clearing packet may be available for this case.

CTA:

Continue to packet builder

This user may eventually count against the partner's packet cap, but only when the packet is generated or packet access is unlocked.

Lane B: More information needed

Copy:

We need more information before we can identify the right record-clearing path.

CTA:

Continue to my Briefcase

This user does **not** count against the packet cap yet.

Lane C: Guidance-only / no packet path right now

Copy:

Based on your answers, this case does not appear to have a packet-ready record-clearing path right now. Your Briefcase will still save your screening and next steps.

CTA:

View my next steps

This user does **not** count against the packet cap.

Lane D: Not eligible right now

Copy:

Based on your answers, this case may not be eligible for record clearing right now. We'll save your Briefcase and show you what may need to happen next.

CTA:

View my Briefcase

This user does **not** count against the packet cap.

The Usage Cap Rule

This should be a hard product rule:

Partner portal accounts do not count against the partner cap.

Screenings do not count against the partner cap.

Ineligible users do not count against the partner cap.

Guidance-only users do not count against the partner cap.

Users who need more information do not count against the partner cap.

The partner cap is only reduced when a user reaches a packet-generating record-clearing path.

For a partner that purchases **500 packets**, the cap should mean:

500 packet opportunities / packet generations, not 500 accounts and not 500 screenings.

Recommended counting event

I would count against the cap at:

Packet generated

Not merely when “a path may be available.”

That is cleaner because someone may screen as possibly eligible but never finish the packet builder. If they do not generate a packet, the partner should not lose one of their 500.

So the clean logic is:

User action/status	Counts against partner cap?
Creates account	No
Starts screening	No
Completes screening	No
No path available	No
Guidance-only result	No
More information needed	No
Possible path shown	No
Packet builder started	No
Packet generated	Yes

Additional packet for another eligible case Yes

Briefcase Experience for Non-Eligible Users

Even if the user is not eligible, they should still keep their Briefcase.

Their Briefcase should show:

Your screening is saved

Then one of these statuses:

- No packet path found right now
- More information needed
- Waiting period not met
- Court records needed
- Case type not supported
- Guidance-only next steps available

CTA options:

View my next steps

Check another case

Request partner support, if enabled

Update my information

This is important because partner users may become eligible later or may have another case that qualifies.

Briefcase Experience for Eligible Users

If a packet path may be available, the Briefcase should show:

A packet path may be available

Copy:

Your access is covered through [Partner Name]. Complete the state-specific packet builder so we can prepare your documents.

CTA:

Continue packet builder

Once they generate the packet:

Packet generated

At that moment, the partner usage count goes up by 1.

Clean Updated Partner Flow

Partner landing page → Create account/sign in → Verify email → Screening inside Briefcase → Accuracy review → Result → Briefcase saved no matter what → If no path, guidance/support only and no cap usage → If packet path, state-specific packet builder → Generate packet → Count against partner packet cap → Filing support → Outcome reporting

Best Product Framing

The partner model should not be:

500 users

It should be:

500 packet-generating cases

Then internally you track:

- Total partner accounts
- Screenings started
- Screenings completed
- No-path users
- Guidance-only users
- More-info-needed users
- Packet-path users
- Packets generated

- Outcomes reported

That gives partners a much better story:

“You had 1,200 people create Briefcases, 800 completed screenings, 300 had a possible record-clearing path, and 215 generated packets — using 215 of your 500 covered packet slots.”
